

Me to NL

Something troubled me about the letter from Karen O'Kane of BBFPO. She states that BT requires access points every 300 metres and doesn't like fields. When communities, in desperation, spend large amounts of time and money installing their own fibre they just dig a trench across a field or fields and put the cable in. Technically fibre needs no amplification for a considerable distance. Last time I looked it was kms. It sounds like you have been treated to the sort of techno-b\*\*\*\*\*s that the rest of us get all the time. BT decides to make a rule that ensures that it doesn't have to do things it doesn't want to.

All the best from an unsurprised

Peter

NL to me

And the whole project relates to a rural area with lots of fields! Ridiculous!

I will look at the file when I'm back
